

UX & Flow — World-Class Build Experience

The user is an agency producer: a professional who runs this many times a week and wants speed, control, and confidence about cost. The product's one job: move them from an idea to a downloadable, believable 45-second film without ever feeling lost or surprised by a bill.

Design direction (don't ship a generic SaaS dashboard)

Ground the look in the subject — a **studio control room**: calm, dark, layered, precise. Depth comes from elevation and shadow, not decoration. Avoid the AI-default looks (cream + serif + terracotta; pure-black + acid accent; broadsheet hairlines).

Signature element — the Build Spine. A persistent horizontal rail representing the 45s

timeline that *fills in as stages complete* — script beats, then a-roll, then b-roll per scene, then sound layers, then the final cut. It's navigation and a literal preview of the film assembling. It's grounded in the subject (a film IS a timeline) and it's the one thing the product is remembered by. Spend the boldness here; keep everything else quiet.

Tokens (starting point — refine in build):

- Palette grounded in lighting temperature (tungsten warm vs daylight cool):
 - `--surface-0: #0E1116` `--surface-1: #161B22` `--surface-2: #1F2630`
 - `--ink: #E6EAF0` `--ink-dim: #93A1B0`
 - `--active: #5AA9E6` (in-progress / daylight) · `--ready: #E8B04B` (rendered / tungsten)
 - `--alert: #E5604D` (over budget)
- Type with personality, used with restraint:
 - Display: **General Sans** (Fontshare, free) — stage titles, scene numbers
 - Body: **Geist Sans** — UI text

- Data: **Geist Mono** — *all* cost, duration, credit, and timestamp figures (they read like instrument readouts in a control room — a subject-grounded choice, not decoration)
- Motion: one orchestrated reveal (the spine filling as a stage finishes); quiet hovers; respect `prefers-reduced-motion`. Extra animation reads as AI-generated — resist it.
- Copy: active voice, named by what the producer controls. "Generate b-roll," "Add sounds,"
"Render final." Errors are directive, not apologetic. Empty states invite the next action.

Glassmorphism belongs to the *content*, not the *chrome*. The "glass box" style is an on-video overlay (rendered into the MP4), not the app skin. Keeping the app surfaces solid and the glass for the film is the disciplined choice — see overlays below.

Layout

Left: the produce stages. Center: the active stage. Right: the producer co-pilot, always present. Bottom: the Build Spine. Top: active brain + influencer + an always-visible cost meter (this is a cost-sensitive product — never hide the number).

Setup (occasional; reused across videos)

- **Connect Tools.** Connect ElevenLabs, Higgsfield, HeyGen (and, for the agency build, the GAS-managed Anthropic key). Per-tenant credential vault (encrypted at rest; never exposed client-side). Show connection status + which scopes are granted. For Iteration 1 GAS connects GAS's accounts; for market customers each connects their own (their keys, their

provider spend — see `cost-controls.md`).
Block the produce flow until required tools
are connected.

- **Influencers.** Create and manage reusable influencers — *Build an Influencer* (synthetic) or *Build Me* (digital twin). See `influencer-builder.md` .
- **Brains.** Connect a website and/or the GAS Sheet → Drive knowledge source. See `brains.md` .

Produce (the repeatable journey)

Each stage advances the Build Spine. Your six tabs live here, plus the steps the flow needs.

Stage	Your tab	What happens
1. Brief	—	Pick brain + influencer; topic, segment; toggles: pop-ups (glass-box) off/on, music

Stage	Your tab	What happens
		off/on, SFX/ambient off/on , resolution, b-roll tier; voice mode.
2. Script & Scenes	—	The producer co-pilot drafts the 45s script + scene-by-scene layout + camera angles + shot list; you refine by chatting. Self- verifies.
3. Review & Approve	—	Cost estimate + breakdown + dials; hard budget gate . Nothing paid runs before this.
4. A-Roll	(your influencer)	The influencer delivers the script

Stage	Your tab	What happens
		(HeyGen, audio-driven).
5. Build B-Rolls	Build B Rolls	Higgsfield per scene; producer suggests shots/angles; regenerate any scene.
6. Add Sounds	Add Sounds	<i>Optional.</i> Add arc-following music and/or per-scene SFX/ambient; preview the mix. Skip entirely if you want VO only.
7. Stitch Video	Stitch Video	Assemble draft → review (gate) → render final. Glass-box pop-ups applied here.
8. QA	—	Automated integrity check

Stage	Your tab	What happens
		(tiered severity) on the finished cut.
9. Preview & Download	Preview and Download	Final cut + download. (<i>Publish / Meta ad-loading = Iteration 2.</i>)

"Build an Influencer" and "Build Me" sit in **Setup**
→ **Influencers** (built once, reused),
not in the per-video flow — that's the one
change to your tab list, and it's why a video
takes a minute instead of rebuilding a persona
every time.

The producer co-pilot

A persistent Claude assistant across the
produce flow — the "producer in the room."

- **In Script & Scenes:** proposes the script
against the 45s spine, then a **scene layout**
(what each beat shows), **camera angles**

and movement (e.g. "open on a slow push-in medium close-up; cut to a wide establishing for the insight; over-the-shoulder for the example"), and **shot composition**, and turns each scene into a b-roll prompt.

- **It carries two embedded libraries:** a cinematography vocabulary (shot sizes, moves, lensing, pacing for short-form) and the **hyper-realism prompt library** from `influencer-builder.md`, so generated humans and scenes stay believable.
- **It's conversational AND structured:** chat to refine, but every change writes back to the structured `plan` (scenes, captions, pop-ups, audio map) that the pipeline renders.
- It explains trade-offs in cost terms when relevant ("adding a 5th scene adds ~one b-roll clip").

Glass-box overlays (pop-ups)

The on-screen pop-up style. Pop-ups are off by default; when on, the **style is itself a toggle** — the operator chooses per video (and can switch off the glass look entirely):

- **Glass** (glassmorphism) — frosted, semi-transparent panel (backdrop blur, ~12–16px radius, hairline light border, soft shadow), brand-tinted from `clients.brand`.
- **Solid** — opaque brand card, for high-contrast feeds.
- **Minimal** — plain animated text, no panel. The chosen style animates in on its cue with a subtle accent SFX, rendered into the timeline at the producer's cued timestamps. Glass is a preset, not a default — only when asked.

Quality floor (every screen)

Responsive to mobile, visible keyboard focus, reduced-motion respected, optimistic UI with clear pending/failed states on long renders

(the Spine shows per-stage status), and the
cost
readout never disappears.
